

Medical Legal Document Analysis Report

Extracted Variables

Agreed Upon Body Parts: None

Disagreed Upon Body Parts: None

Previous Injuries: previous back injury in 2020

Applicant Attorney Alleged Body Parts: None

Demographics

Q1: What is the claimant's full name?

A: John Doe

Q2: What is the claimant's address?

A: The claimant's address is not provided in the document.

Q3: What is the claim number or case number?

A: - Claim Number: WC-2024-001 - WCAB (Case) Number: ADJ-1234567

Q4: What is the date of injury?

A: 03/15/2024

History Of Injury

Q1: How did the injury occur according to the claimant?

A: While lifting heavy materials at work site.

Q2: What was the claimant doing at the time of injury?

A: Lifting heavy materials at the work site.

Q3: Were there any witnesses to the injury?

A: Not documented. The provided record does not mention any witnesses to the injury.

Q4: What immediate symptoms did the claimant experience?

A: The document does not specify any immediate symptoms. It only states that the patient "sustained injury to lower back and right shoulder while lifting heavy materials at work site," with body parts affected listed as lower back (lumbar spine), right shoulder, and right arm. No specific symptoms (e.g., pain, numbness, weakness) are documented.

Chief Complaints

Q1: What are the main symptoms or complaints for each affected body part?

A: - Lower back (lumbar spine): No explicit symptoms or subjective complaints documented in the record. - Right shoulder: No explicit symptoms or subjective complaints documented in the record. -

Right arm: No explicit symptoms or subjective complaints documented in the record. Note: The document identifies the affected body parts and provides diagnostic findings/diagnoses (e.g., L4–L5 disc herniation; right shoulder strain) and mechanism of injury (lifting heavy materials), but it does not state specific patient-reported symptoms (e.g., pain, numbness, weakness, limited range of motion).

Q2: How do the symptoms affect daily activities?

A: The document does not expressly describe the impact of symptoms on activities of daily living (ADLs). The only documented functional effects are: - "Patient is currently off work due to injury." - "Work restrictions: No lifting over 20 pounds." No additional limitations are specified regarding sitting, standing, walking, bending, reaching/overhead use, self-care, household tasks, driving, sleep, or recreation.

Q3: What makes the symptoms better or worse?

A: The document does not specify any aggravating or alleviating factors for the patient's symptoms. Note: - Mechanism of injury: Symptoms began after lifting heavy materials at the work site. - Work restriction: "No lifting over 20 pounds" is noted, but the document does not explicitly state whether lifting worsens symptoms or whether any measures improve them.

Q4: Rate the pain level described (if mentioned).

A: No pain level is documented or described in the provided record.

Medical History

Q1: What is the claimant's past medical history?

A: Patient reports a previous back injury in 2020.

Q2: List any previous injuries or conditions.

A: ["Patient reports previous back injury in 2020"]

Q3: What medications is the claimant currently taking?

A: - Ibuprofen 800mg twice daily - Muscle relaxants as needed

Q4: Are there any known allergies?

A: No allergies are documented in the provided record.

Diagnostic Findings

Q1: What diagnostic tests were performed (MRI, X-ray, CT scan, etc.)?

A: Diagnostic tests performed: - MRI of lumbar spine - X-ray of right shoulder

Q2: What were the key findings from each diagnostic test?

A: Key diagnostic findings: - MRI of lumbar spine: shows L4-L5 disc herniation. - X-ray of right shoulder: shows no acute fracture.

Q3: What is the primary diagnosis?

A: Lumbar disc herniation L4-L5.

Q4: Are there any secondary diagnoses?

A: Not explicitly. The document does not designate "primary" vs. "secondary" diagnoses. It lists two diagnostic impressions: 1) Lumbar disc herniation L4–L5 2) Right shoulder strain If the lumbar disc herniation is considered the primary diagnosis, the right shoulder strain would constitute an additional

(secondary) diagnosis.
